

# Build Sophisticated Web Applications in Minutes

HCL Leap offers users a low-code development platform to accelerate the design, build and deployment of applications.

## Accelerate Your Workflow With Automated Processes

Does your company currently rely on spreadsheets, paper-driven workflows, email or other manual processes to get work done? Do you face challenges to capture quality customer leads, monitor financial accounts or synchronize work with your business partners? All too often businesses struggle to keep up with the necessary innovation needed to improve their processes and efficiency. IT organizations are typically overwhelmed with projects and lack the resources to develop and deploy meaningful solutions quickly.

HCL Leap can enable “citizen” developers to build straightforward applications with ready-made components, such as customer lead capture, special customer offers or business dashboards. But these same development techniques can also help “professional” developers be more efficient with larger projects, like integrations with legacy applications and backend systems. Customizing solutions that enable employees to do their jobs more effectively and secure enough to meet the needs of IT has never been easier.

### Leap Benefits

- Requires fewer coding skills
- Improves agility – anyone can become a developer
- Lowers development and deployment costs
- Streamlines collaboration
- Improves employee and customer experiences
- Increases organizational productivity

Easily create sophisticated web applications for data collection and process automation without code.

## Key Features

### Create Apps from Spreadsheets in Minutes

## Benefits

Improve efficiency of email file sharing with a central app that provides the forms, views and access controls you need to securely get work done.

### Intuitive Browser-Based Designer

Build custom apps easily with a user experience that guides you through the process – deploy your apps in minutes.

### Integrate with Anything

Integrate your app with external systems to prepopulate form values; look-up data and add services without needing to know anything about the backend.

### Automate Processes with Workflows

Define document workflows down to the user level to determine who gets assigned, notified, what they see and can do, what connections are called and who receives alerts when the process is complete.

### Build with Style

The style editor lets business developers customize the look of their apps without having to know CSS.

### Built-in IT Governance

IT admin controls include defining who can create and use apps, what types and sizes of files can be added, which services and integrations are allowed, as well as the ability to sandbox the use of JavaScript.
